

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Information Wanted

From all who are acquainted with the following three birds: Dickcissel (*Spiza Americana*) and Grasshopper and Henslow's Sparrows (*Ammodramus savannarum passerinus*) and *A. henslowi*).

It is well known that Dickcissel is constantly changing his range, and that the two sparrows are rather local in their distribution, often changing their summer abodes from year to year. It has been noticed in some localities that these three birds are much more numerous this season than ever before, while other species seem to be in normal numbers. Have you noticed anything unusual about them, and if so can you account for it in any way? Word on this subject is especially desired from those studying in New York, Pennsylvania, Ohio, Kentucky, Michigan, Indiana, Illinois and Wisconsin. This work applies to all, whether you know any of the birds or not. If you do not, drop a card saying so, that we may determine as nearly as possible the range of these birds for 1894.

Send all notes to Lynds Jones, Oberlin, O.

Notes.

A ROBIN'S NEST.—I have a robin's nest that differs in construction from those mentioned by the Oological Committee in their report, and from Oliver Davie's. This nest is com-

posed first of oak leaves and wool, then grass and clover stems, next with a layer of manure instead of mud, as is generally the case, and lastly the regulation lining of small roots. This nest was taken July 8th. There was no scarcity of mud when the nest was built.

A HUNGRY JAY.—On July 5th I found a Blue Jay eating a young Bluebird nearly full grown. It had eaten the head, neck and viscera. On first discovering the Blue Jay I scared it away and threw what remained of the victim under some bushes. In a short time I returned that way and found the Jay eating the Bluebird. He was so greedy that he had hunted up the bird to finish his meal. It is needless to say that I shot him.

HOWARD P. MITCHELL.
